Audit report for Pizza Mița

Pizza Mița is a made-up pizzeria. I first built a weak version of its site on purpose, with problems I planted and wrote down on a list beforehand. I checked it with automated tools, fixed what I found, and then measured both versions again, with the same tools, from the same computer.

Check it yourself:

The site before · The fixed site · Code and data, on GitHub (https://github.com/AndreiBanu1/qz-demo-pizzerie)

In short

Problems found	Fixed	Left on purpose
18	17	1

The problems that matter most

Fixed — On a phone, the reservation form runs off the screen
People often book from their phone, on the go. If they can't see the submit button, they don't finish the booking: you lose the table, or only the most patient ones call you.
The fix: I make the form no wider than the screen, with the fields stacked on a phone, and I enlarge the text in the fields to the size at which the iPhone no longer zooms in.

Fixed — The "Sună acum" (Call now) button isn't a real phone link
The phone is the shortest path from a hungry customer to an order. Someone who gets around with the keyboard alone can't call you from the site at all.
The fix: I turn the button into a real phone link that works with a finger, a mouse and the keyboard, and that is clearly visible when selected.

Fixed — Google receives empty pages
Google sometimes copes with pages like these, but more slowly and not always. Other search engines and AI assistants often see only the empty page. If they can't see your menu and your hours, they can't recommend you to people looking for a pizzeria.
The fix: I build the pages ahead of time, at publish time, so that every address sends the full text straight away: the name, the menu, the hours and the address.

Fixed — The photos are huge and slow the site down on a phone
People looking for a pizzeria on their phone don't wait. Many close the page before they see anything, and those on a limited plan use up their mobile data on your photos.
The fix: I shrink each photo to the size it's shown at, save it in a modern, lighter format, declare its size, and let the photos lower down the page load only when you get to them.

Fixed — The "Deschis acum" (Open now) message is wrong for a few hours a day
A customer who sees "Closed" doesn't come and doesn't call, even though you're expecting them. One who sees "Open" after closing comes for nothing and leaves annoyed.
The fix: I calculate the hours in Romanian time, including the switch to summer and winter time, and I check a few edge times automatically.

Each area, before and after

AREA	BEFORE	AFTER
Speed	Red	Green
Accessibility	Red	Green
Working order	Red	Green
Google (SEO)	Red	Green
Security	Yellow	Green

Red: at least one critical or high problem. Yellow: at least one medium problem. Green: nothing worse than small details.
After the fixes I count only the problems still open; the one left on purpose doesn't count.

BEFORE AFTER
added up over every page and every device tested

Before and after, in numbers

I measured both versions on the same day, from the same computer, with the same tools: the weak version on 14 November 2026, 07:54, the fixed one on 14 November 2026, 17:34, Romanian time. I measured the fixed version twice; I explain why in the limits, at the end.

A few terms

- LCP (Largest Contentful Paint) is the time until the largest thing on the page, usually the top photo or heading, appears on screen.
- CLS (Cumulative Layout Shift) shows how much parts of the page jump around while it loads; the closer to zero, the better.
- TBT (Total Blocking Time) is the time during loading when the page is too busy to respond if you tap it.
- CSP (Content Security Policy) is a list sent to the browser of the places the page may load code, images and fonts from; anything else is blocked.

The scores, LCP, CLS, TBT, page weight and delay come from Lighthouse, on a simulated phone. Each one is the median of three runs, the middle value.

How I rounded: LCP in seconds, with one decimal; TBT in milliseconds, rounded to ten, as Lighthouse does; CLS with two decimals; page weight in MB with one decimal, and below one MB in whole kB. Each difference is worked out from the unrounded values and rounded the same way.

What I found and what I fixed

Each problem has a severity, the area and pages it affects, the evidence from the measurements, the fix and its status at the after run.

Each fix is a commit, a saved and dated change in the code's public history. You can open every commit on GitHub.

How I rated severity

Critical: A customer can't call, read the menu or book a table, or something exposes the site.

High: Affects many visitors, or Google can't read the page.

Medium: Slows down or gets in the way of some visitors.

Low: Polish.

F-01 Critical Fixed

On a phone, the reservation form runs off the screen

Area Working order

Pages Reservation

WHAT I FOUND

I opened the reservation page on an iPhone and on an Android phone. The form has a fixed width, wider than the screen, so the page slides sideways and the submit button stays off screen. On top of that, the text in the fields is

so small that the iPhone zooms the page in by itself when you tap a field.

WHY IT MATTERS

People often book from their phone, on the go. If they can't see the submit button, they don't finish the booking: you lose the table, or only the most patient ones call you.

THE FIX

I make the form no wider than the screen, with the fields stacked on a phone, and I enlarge the text in the fields to the size at which the iPhone no longer zooms in.

The “Sună acum” (Call now) button isn't a real phone link

Area Accessibility
Pages Home

WHAT I FOUND

The “Sună acum” button looks like a button, but behind it there is no phone link. I looked for a phone link with this text on the page and there isn't one, on any of the three devices. I then tried the Tab key, the way people who

don't use a mouse or a finger get around: you never reach it.

WHY IT MATTERS

The phone is the shortest path from a hungry customer to an order. Someone who gets around with the keyboard alone can't call you from the site at all.

THE FIX

I turn the button into a real phone link that works with a finger, a mouse and the keyboard, and that is clearly visible when selected.

THE FIX, ON GITHUB

Commit 1c4e456(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/1c4e456)

F-04 High Fixed

The photos are huge and slow the site down on a phone

Area Speed

Pages Home, Menu

WHAT I FOUND

The photos on the home page and in the menu are at the camera's original size, much larger than the space they fill. On a simulated phone with an ordinary mobile connection, the large home-page photo appeared only after about 15 seconds, and the menu page downloads about 23 MB. On top of that, the top photo has no declared size, so the text below it jumps down when it loads.

WHY IT MATTERS

People looking for a pizzeria on their phone don't wait. Many close the page before they see anything, and those on a limited plan use up their mobile data on your photos.

THE FIX

I shrink each photo to the size it's shown at, save it in a modern, lighter format, declare its size, and let the photos lower down the page load only when you get to them.

The “Deschis acum” (Open now) message is wrong for a few hours a day

Area Working order
Pages Home

WHAT I FOUND

The home page tells visitors whether the pizzeria is open. I set the clock to known times, in Romanian time. On a Tuesday before lunch, while the pizzeria was open, the page said “Închis” (Closed). On a Friday night, after

closing, it said “Deschis acum” (Open now). The calculation uses universal time (London's winter time), not Romanian time, so the message is wrong every day around opening and closing.

WHY IT MATTERS

A customer who sees “Closed” doesn't come and doesn't call, even though you're expecting them. One who sees “Open” after closing comes for nothing and leaves annoyed.

THE FIX

I calculate the hours in Romanian time, including the switch to summer and winter time, and I check a few edge times automatically.

F-06 High Fixed

Every page is called “Home” and has no description

Area Google (SEO)

Pages All pages

WHAT I FOUND

The title of each page, the one that shows as the blue link in Google and on the browser tab, is “Home”, in

English, on all three pages. None of them has the short description that appears under the link in search results.

WHY IT MATTERS

In Google, people choose what to click by the title and the description. “Home” doesn't say who you are, what you cook or where you are. Without a description, Google picks some text from the page by itself, often a poor fit.

THE FIX

I give each page its own title, with the pizzeria's name and the town, and a short description written for people.

F-07 High Left on purpose

Google is asked not to show the site (on purpose)

Area Google (SEO)

Pages All pages

WHAT I FOUND

Every page asks Google, in two places, not to show it in search results. I put that there on purpose.

WHY IT MATTERS

On a real restaurant's site this would hide the site from Google: nobody would find you there. This is a demonstration site with a made-up phone number and address, so it has no business appearing in search results.

THE FIX

I change nothing on this site. On a real site I would remove both signals before launch and then check that Google can show the pages.

WHY I CHANGED NOTHING

Intentional: this is a demonstration site and must not appear in Google. On a real site it would hide the site from Google, so I would remove these signals before launch.

F-08 Medium Fixed

The menu prices are barely visible

Area Accessibility

Pages Menu

WHAT I FOUND

The prices are written in very light grey on a white background. The automated accessibility check (how easily anyone can use the site, including people with poor eyesight) flagged them as hard to read on all three devices tested.

WHY IT MATTERS

The price is one of the first things a customer looks for in a menu. Someone with poor eyesight, or reading on a phone in the sun, can't make it out and may leave without ordering.

THE FIX

I write the prices in a dark colour, different enough from the background that anyone can read them easily.

The reservation form fields have no labels

Area Accessibility

Pages Reservation

WHAT I FOUND

Each field has only a grey hint inside it (for example “Nume”, Name), which disappears when you start typing. There is no real label tied to the field. Because of that, my automated tests couldn't find the fields by name and couldn't fill in the form at all.

WHY IT MATTERS

Someone who has started typing and looks back no longer knows which field they're filling in. Programs that read the screen aloud for blind people, and voice commands, rely on these labels. Every abandoned booking is an empty table.

THE FIX

I add a visible label above each field, tied to it properly, and keep the grey text only as an example.

F–11 Medium Fixed

The “Meniu” (Menu) link at the bottom of the page leads to a page that doesn't exist

Area Working order

Pages All pages

WHAT I FOUND

At the bottom of every page, the “Meniu” link goes to a wrong address, and the visitor lands on the “Pagina nu există” (Page doesn't exist) page. I opened every link on the three pages, on three devices, and only this one is broken.

WHY IT MATTERS

Someone who read to the bottom and wants the menu runs into an error. Some give up there, even though they were ready to order.

THE FIX

I correct the link's address. The automated test (Playwright) that opens every internal link on the three pages runs in every measurement of the site, and every build of the site automatically checks that the report's links to its evidence lead to files that exist.

THE FIX, ON GITHUB

Commit 6e5d978(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/6e5d978)

F–12 Medium Fixed

The heading font holds the page back until it downloads

Area Speed

Pages All pages

WHAT I FOUND

The heading font comes from Google Fonts with every weight and italic variant, although the site uses only a few. The browser waits to download it before showing anything on screen. On a simulated phone, the speed test estimates that without the files holding the page back, each page would appear 814 to 835 milliseconds sooner, almost a second. The font is the slowest of those files.

WHY IT MATTERS

Every moment of blank screen makes the site feel slow, especially on a phone with a weak signal.

THE FIX

I host the font on the same server as the site, with only the weights in use, and let the text appear straight away, with the font applied once it's ready.

THE FIX, ON GITHUB

Commit bd762f8(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/bd762f8)

F–13 Medium Fixed

Google doesn't get the pizzeria's details in a form it understands directly

Area Google (SEO)

Pages All pages

WHAT I FOUND

No page has structured data, a hidden block in a standard format that tells Google directly the name, address, phone, hours, menu and prices. I looked for every detail I expect for a restaurant and they are all missing.

WHY IT MATTERS

Without this data Google has to guess the hours and address from the text, and here even the text isn't in the page. You miss the chance for your hours and menu to show up right in the search results.

THE FIX

I add structured data for the restaurant, with the same details as on the page, and check automatically that the page as first received, before its program runs, contains all of them. The Schema.org validator and Google's Rich Results Test can be used on top, as a manual check.

EVIDENCE

THE FIX, ON GITHUB

Commit e2a4b02(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/e2a4b02)

F–14 Medium Fixed

The site says it's written in English

Area Google (SEO)

Pages All pages

WHAT I FOUND

The code of every page announces English, although all the text is in Romanian.

WHY IT MATTERS

Programs that read the screen aloud for blind people then use English pronunciation, and the text becomes hard to follow. The browser may offer to translate the page “from English”, and Google gets the wrong signal about who you're speaking to.

THE FIX

I declare Romanian as the language on every page.

THE FIX, ON GITHUB

Commit dc0873c(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/dc0873c)

F–15 Medium Fixed

The basic protections a site can ask the browser for are missing

Area Security
Pages All pages

WHAT I FOUND

I checked which safety instructions the site sends the browser along with each page. Three important ones are missing: the content policy (CSP, a list of the places the page is allowed to load code from), the ban on being shown inside other sites, and limits on access to the camera, microphone or location. Mozilla HTTP Observatory, a public security test, gave the site a C grade, with 55 points.

WHY IT MATTERS

Without them, a foreign site could show your page inside itself to trick your visitors, and if someone ever managed to slip foreign code into the site, the browser wouldn't stop it. On this site the risk is low, because it neither asks for nor sends any data, but these protections cost little and are standard.

THE FIX

I add these instructions to the server settings, check that they don't block anything on the site, and run the Mozilla test again.

THE FIX, ON GITHUB

The fix was made in several commits, in order:

Commit a32b3db(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/a32b3db)

Commit bcb0a0f(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/bcb0a0f)

Safari adds a hidden style, text-overflow:inherit, to every drop-down list by itself; the check on the live site found the strict policy reporting it, so the second commit allows exactly that one style by its fingerprint (a hash, hence 'unsafe-hashes' in the policy), and every other style written straight into the page stays blocked.

F–16 Medium Fixed

The site's original source code is public

Area Security

Pages All pages

WHAT I FOUND

Along with the site, a code map is published (a source map, a file that rebuilds the original source code, comments included). Anyone can download it.

WHY IT MATTERS

This site's code holds no passwords or keys, so nothing secret leaks. Still, it shows anyone how the site is built and makes it easier to look for weak spots, with no benefit to your customers.

THE FIX

I stop publishing these files when I build the site and check that their address no longer answers.

EVIDENCE

Public source code file

THE FIX, ON GITHUB

Commit f283a36(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/f283a36)

F–17 Low Fixed

Addresses that don't exist answer as if they did

Area Google (SEO)

Pages All pages

WHAT I FOUND

I opened a made-up address on the site. The visitor sees the “Pagina nu există” (Page doesn't exist) page, with the way back to the home page, but the server tells the browser and Google that the page exists and all is well, instead of saying it's missing.

WHY IT MATTERS

Google may keep wrong addresses as real pages of your site, all with the same error message, and waste its time on them instead of reading the pages that matter.

THE FIX

I set the server to answer “page not found” for any unknown address, keeping the friendly page with the way back to the home page.

EVIDENCE

Failed Playwright test

`qa.failures.23, qa.failures.24, qa.failures.25`

Before not-found.spec.ts › an unknown address returns 404 and offers the way home · iPhone 15, Pixel 7, computer

SCREENSHOTS OF THE FAILED TESTS, BEFORE

Screenshot, computer

THE FIX, ON GITHUB

The fix was made in several commits, in order:

Commit 2ac9cf1(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/2ac9cf1)

Commit d4b55c7(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/d4b55c7)

After the first commit, the address of the tab icon (/favicon.ico), which was missing, also correctly answered “page not found”, and the browser logged that as an error on every visit; the second commit

adds the icon.

F–18 Low Fixed

Some of the tools I build the site with have known security problems

Area Security

Pages All pages

WHAT I FOUND

I ran the site's list of components through npm audit, an automated check for known security problems. It found 2 problems marked critical, 1 high and 3 moderate. All of them are in the testing and build tools (Vite and Vitest), which run only while I work on the site, not in the pages a visitor receives.

WHY IT MATTERS

Your customers aren't exposed, because these tools never reach the site. The risk is to the computer of whoever works on the site, and tools left behind get harder and harder to update.

THE FIX

The fixes need new major versions of the build tools (Vite and Vitest), a bigger change than a simple update. I upgrade them, check that the site still builds the same way, and run the check again.

THE FIX, ON GITHUB

Commit d6e2aa9(https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/d6e2aa9)

What we planted and what was found

Before the first measurement, I wrote down the 15 problems planted in the weak version. The list is public, and the code history shows it was written first.

The list of planted problems, on GitHub(https://github.com/AndreiBanu1/qz-demo-pizzerie/blob/main/audit/planted-issues.json)

Caught by the automated tools

Lighthouse, axe, my own check of the page as Google receives it, Mozilla HTTP Observatory and the check for public files.

P–01 The photos are huge and slow the site down on a phone	**F–04**
P–02 The heading font holds the page back until it downloads	**F–12**
P–03 The photos and the logo have no text description	**F–10**
P–04 The menu prices are barely visible	**F–08**
P–09 Every page is called “Home” and has no description	**F–06**
P–10 Google receives empty pages	**F–03**
P–11 Google doesn't get the pizzeria's details in a form it understands directly	**F–13**
P–12 The site says it's written in English	**F–14**
P–13 The basic protections a site can ask the browser for are missing	**F–15**

P–14 The site's original source code is public **F–16**

Caught only by the Playwright tests

The automated checking tools didn't see these. Only the tests I wrote, which use the site the way a visitor does, caught them. I did no manual checks.

P–05 The reservation form fields have no labels **F–09**

axe didn't flag it: on the Reservation page it found only photos without a text description. axe accepts the grey text inside a field as the field's name.

P–06 The “Sună acum” (Call now) button isn't a real phone link **F–02**

axe didn't flag it: on the Home page it found only photos without a text description.

P–07 On a phone, the reservation form runs off the screen **F–01**

P–08 The “Deschis acum” (Open now) message is wrong for a few hours a day **F–05**

P–15 The “Meniu” (Menu) link at the bottom of the page leads to a page that doesn't exist **F–11**

linkinator followed only 3 addresses and found no broken link, because on the weak version the pages arrive empty.

Not caught

Planted problems that nothing found. I show them here rather than hide them.

None: every planted problem was found.

Real problems nobody planted

I found these during the audit, although they weren't on the list.

Google is asked not to show the site (on purpose) **F–07**

Addresses that don't exist answer as if they did **F–17**

Some of the tools I build the site with have known security problems **F–18**

How I measured, and the limits of this report

The measurements

Before: the weak version
14 November 2026, 07:54, Romanian time

pizza-mita-inainte.pages.dev

Code measured: 1b68d35 (https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/1b68d358ec7b383f6920fdef5862f58b4da3d6f9)

After: the fixed version
14 November 2026, 17:34, Romanian time

pizza-mita.pages.dev

Code measured: d4b55c7 (https://github.com/AndreiBanu1/qz-demo-pizzerie/commit/d4b55c7e9b75a9eb2d03b517f9fcc4e9160b7036)

Devices

- Lighthouse: a simulated mid-range Android phone (Moto G Power), with its mobile connection and processor slowed down on purpose, Lighthouse's standard phone setting.
- Playwright and axe: iPhone 15 (through WebKit, Safari's engine), Pixel 7 (through Chromium, Chrome's engine) and a computer with Chrome.

Tools and versions

The same for both measurements:

- `lighthouse` 13.6.0
- `@playwright/test` 1.64.1
- `@axe-core/playwright` 4.14.0
- `linkinator` 8.1.0
- `node-html-parser` 9.0.7
- Mozilla HTTP Observatory, the public online service
- npm audit, the check for known problems in the site's components

Limits

- This is lab data, from tools, not from real visitors. On your customers' phones the figures may differ.
- Lighthouse gives slightly different results on every run, so I ran each page three times and show the median, the middle value.
- The noindex request, which asks Google not to show the site, is there on purpose, because this is a demo site (F-07). That is why Lighthouse's SEO score doesn't reach the top on the fixed site.

- I didn't do the manual checks: listening to the site with VoiceOver (the iPhone's screen reader), the Schema.org validator and Google's Rich Results Test. The automated results don't replace them.
- When I write “iPhone”, I mean Safari's engine (WebKit), run by Playwright on a computer with an iPhone's screen, not a real iPhone. I didn't test on real phones.
- I didn't assess HSTS, the instruction that makes the browser visit the site only over a secure connection: pages.dev addresses are already on the browsers' list of sites that only open securely.
- I ran no active security tests, meaning attempted attacks, and no tests of the secure connection (TLS), which Cloudflare looks after. I only checked what the site sends and which files anyone can download.
- The pages of this report are not part of the measurements. The link check doesn't enter them either, because the report links to the raw files of the run that was still being made.
- I measured the fixed version twice. The first run, 2026-11-14-after, made on 14 November 2026, 07:56, Romanian time, right after the weak version's, gave a best practices score of 96 on every page: since the first fix for F-17, any address that doesn't exist got a real “page not found” answer, including /favicon.ico, the address of the tab icon, which was still missing, and the browser logged that as an error. The second fix for F-17, commit d4b55c7, added the icon, and the report uses the run made again after it, 2026-11-14-after-2.

  All the files of the first run, on GitHub(https://github.com/AndreiBanu1/qz-demo-pizzerie/tree/main/audit/runs/2026-11-14-after)

Check the speed yourself

Google's PageSpeed Insights runs Lighthouse on Google's servers, so your figures will be slightly different from mine.
